A;Description: dissolves the fibrin of blood clots; acts as a proteolytic fact;
ns the walls of the graafian follicle; also activates the urokinase-type plasm. nger.
A;Bathway: fibrinolysis
A;Bathway: fibrinolysis
C;Superfamily: plasmin; kringle homology; plasminogen-related protein precurso come C;Keywords: duplication; fibrinolysis; glycoprotein; hydrolase; kidney; kringle
C;Keywords: duplication; fibrinolysis; glycoprotein; hydrolase; kidney; kringle

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Mutational analysis of the genes encoding urokinase-type plasminogen
activator (uPA) and its inhibitor Pal-1 in advanced ovarian cancer.";

Electrophoresis 18:686-689(1997).

-!- FUNCTION: Potent plasminogen activator and is clinically used for
therapy of thrombolytic disorders.

-!- FUNCTION: Potent plasminogen activator and is clinically used for
--- CARTALTITE Specific cleavage of Arg-|-Val bond in
plasminogen to form plasmin.

-!- SUBUNIT: Found in high and low molecular mass forms. Each consists
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDLINE=96186279; PubMed=8652631;

of two chains, A and B. The high molecular mass form contains a long chain A. Cleavage occurs after residue 155 in the low molecular mass form to yield a short Al chain.

-!- PHARMACEUTICAL: Available under the name Abbokinase (Abbott). Used in Pulmonary Embolism (PE) to initiates fibrinolysis.
-!- SIMILARITY: Belongs to peptidase family S1.
-!- SIMILARITY: Contains 1 BGF-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCWVISATHCFIDYPKKEDYIVYLGRSRINSNTQGEMKFEVENLILHKDYSADTLAHHND

Nagamine Y.;

Nagamine Y.;

Submitted (DEC-1986) to the PIR data bank.

-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.

-!- SIMILARITY: Belongs to peptidase family 81.

-!- SIMILARITY: Contains 1 EGF-like domain.

-!- SIMILARITY: Contains 1 kringle domain.

MEDLINE=90130448; PubMed=2105315;

The structure of the TATA-less rat tissue-type plasminogen activator gene. Species specific sequence divergences in the promoter predict differences in regulation of gene expression.";

J. Biol. Chem. 265:2022-2027(1990).

J. Biol. Chem. 265:2022-2027(1990).

L. FUNCTION: Converts the abundant, but inactive, zymogen plasminogen to plasmin by hydrolyzing a single Arg-val bond in plasminogen. By controlling plasmin-mediated proteolysis, it plays an important controlling plasmin-mediated proteolysis, it plays an important controlling plasminogen single Arg-val bond in magration and many other physiopathological events.

CC -:- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in CC -:- SUBUNIT: Heterodimer of chain A and chain B held by a disulfide
 -!- SUBCELULLAR LOCATION: Secreted, extracellular.
-!- PTM: THE SINGLE CHAIN, ALMOST FULLY ACTIVE ENZYME, CAN BE FURTHER PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER ARG.-108 CATALYZED BY PLASHIN, TISSUE KALLIKERIN OR FACTOR XA.
-!- MISCELLANEOUS: Binds to the kringle structure of the fibrin A chain. Binding to fibrin enhances its catalytic activity.
-!- SIMILARITY: Contains 1 EGF-like domain.
-!- SIMILARITY: Contains 1 Eibronectin type I domain.
-!- SIMILARITY: Contains 2 kringle domains.

this Donner P.;
"Plasminogen activators from the saliva of Desmodus rotundus (common "Plasminogen activators from the selicity.";
Ann. N.Y. Acad. Sci. 667:395-403(1992).
-!-FUNCTION: Probably essential to support the feeding habits of th:
exclusively haematophagous animal. Probable potent thrombolytic

-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.
-!- BUZYME REGULATION: Activity toward plasminogen is stimulated in the presence of fibrin I.
-!- SUBUNIT: Monomer.
-!- DOMAIN: The fibronectin type-I domain mediates binding to fibrin, and the kringle domain apparently mediates fibrin-induced stimulation of activity.
-!- SIMILARITY: Belongs to peptidase family SI.
-!- SIMILARITY: Contains I fibronectin type I domain.
-!- SIMILARITY: Contains I fibronectin type I domain.

Lancod 93:4300-4308 (1999) .

MEDLINES AND 11 is a serum glycoprotein that participates in the initiation of blood coagulation, fibrinolysis, and the generation of bradykinin and amplotenals.

C. I- FUNCTION: Factor XII is a serum glycoprotein that participates in the initiation of blood coagulation, fibrinolysis, and the complex bonds in factor XII to form factor XII to form factor XII.

C. I- PTM: O- AND M-GLYCOXIATED.

C. I- DISEASE: Defects in that whole-blood clotting time is prolonged.

C. I- MISCELANEROUS: Factor XII, prekallikrein, is cleaved by factor XII to form kallikrein, which then cleaves factor XII first to an anionic surface. Prekallikrein is cleaved by factor XII to factor XII.

C. I- SIMILARITY: Contains 1 fibronectin type II domain.

C. I- SIMILARITY: Contains 1 fibronectin type II domain.

C. I- SIMILARITY: Contains 1 kringle domain. Liaemmle B.; "Coagulation factor XII Locarno: the functional defect is caused } "Coagulation acid substitution Arg-353-->Pro leading to loss of a kallikrein cleavage site."; Blood 84:1173-1181(1994).

Mouse plasma kallikrein: cDNA structure, enzyme characterization,

The protein and mRNA levels among species.";

The cell Biol. 9:737-748(1990).

Y FUNCTION: The enzyme cleaves Lys-Arg and Arg-Ser bonds. It

Ard comparation in a recipional reaction, factor XII after its binding

C atlivates, in a recipional reaction, factor XII after its binding

C to a negatively charged surface. It also releases bradykinin from

HWM kininogen and may also play a role in the renin-angiotensin

System by converting procenin into renin.

C -1- CATALYTIC ACTIVITY: Cleaves selectively Arg-|-Xaa and Lys-|-Xaa

bonds, including Lys-|-Arg and Arg-|-Ser bonds in (human)

kininogen to release bradykinin.

T Not Explored To Table isotope labeling and mass spectrometry.";
I Nat. Biotechnol. 21:660-666(2003).
I PUNCTION: The arctiprocal reaction, factor XII after its binding
t or a negatively charged surface. It also releases bradykinin from
HWW kiningen and may also play a role in the renin-angiotensin
System by converting prorent into renin.

C -!- CATALYTIC ACTIVITY: Cleaves selectively Arg-|-Xaa and Lys-|-Xaa
Donda, including Lys-|-Arg and Arg-|-Ser bonds in (human)
kiningen to release bradykinin.

-!- SUBUNIT: The zymogen is activated by factor XIIa, which cleaves LIKIRSKEGRCAQPSRTIQTICLPSMYNDPQFGTSCEITGFGKENSTDYLYPEQ---LKM 179 PARTIAL SEQUENCE, AND DISULFIDE BONDS.

-! TISSUE SPECIFICITY: Synthesized in the acinar cells of the
 pencreas.

PTM: AUTOCATALYTIC CLEAVAGE AFTER LYS-20 LEADS TO BETA-TRYPSIN I RELEASING A TERMINAL HEXAPEPTIDE. SUBSEQUENT CLEAVAGE AFTER LYS-145 LEADS TO ALPHA-TRYPSIN, FURTHER CLEAVAGE AFTER LYS-190 YIZELDS ESEUDOTRYPSIN, A CLEAVAGE MAY ALSO OCCUR AFTER ARG-119. SIMILARITY: Belongs to peptidase family S1.

products.
-!- BNZYME REGULATION: Converted into plasmin by plasminogen activators, both plasminogen and its activator being bound to fibrin. Cannot be activated with streptokinase.
-!- MISCELLANEOUS: Plasmin is inactivated by alpha-2-antiplasmin immediately after dissociation from the clot.
-!- SIMILARITY: Belongs to peptidase family S1. Plasminogen subfamily.
-!- SIMILARITY: Bolongs to peptidase family S1. Plasminogen subfamily.
-!- SIMILARITY: Bolongs to least, 2 kringle domains.
-!- SIMILARITY: MELSS.

-I. FUNCTION: Plasmin dissolves the fibrin of blood clots and acts as embryonic development, tissue remodaling, tumor invasion, and inflammation; in ovulation it weakens the walls of the Gradian follode. It activates the urokinase-type plasminogen activator, collagenases and several complement zymogens, such as Cl and CS. It cleaves fibrin, fibronectin, thrombospondin, laminin and von Willebrand factor.

-!- CATALYTIC ACTIVITY: Preferential cleavage: Lys- |-Xaa > Arg- |-Xaa; higher selectivity than trypsin. Converts fibrin into soluble

 reticulum.
-- TISSUE SPECIFICITY: Expressed in the spiral ganglion, the cells supporting the organ of Corti and the stria vascularis.
-- PTM: Undergoes autoproteolytic activation.
-- SIMILARITY: Belongs to peptidase family S1.
-- SIMILARITY: Contains 1 LDL receptor class A domain.
-- SIMILARITY: Contains 1 SRCR domain.
 CLEAVAGE.

to a negatively charged surface. It also releases bradykinin from system by converting prorenin into renin.

Bygstem by converting prorenin into renin.

CATALYTIC ACTIVITY: Cleaves selectively Arg-|-Xaa and Lys-|-Xaa bonds, including Lys-|-Arg and Arg-|-Ser bonds in (human)

Kininogen to release bradykinin.

SUBUNIT: The Zymogen is activated by factor XIIa, which cleaves and a heavy chain, which chain, which contains the active site, and a heavy chain, which associates with HWM kininogen. These chains are linked by one or more disulfide bonds.

SMINIARITY: Belongs to peptidase family SI. Plasma kallikrein shifanily.

 A MEDLINE=8818529; PubMed=3356193;

A MEDLINE=8818529; PubMed=3356193;

A Marti T., Schaller J., Rickli E.E., Schmid K., Kamerling J.P.,

Gerufg G.J., van Halbeek H., Vliegenthart J.F.;

"The N- and O-linked carbohydrate chains of human, bovine and porcine
plasminogen. Species specificity in relation to sialyiation and
fucosylation patterns.";

Eur. J. Blochem. 173:57-63(1988).

-!- FUNCTION: Plasmin dissolves the fibrin of blood clots and acts as
a proteolytic factor in a variety of other processes including
embryonic development, tissue remodeling, tumor invasion, and
inflammation; in ovultation it weakens the walls of the Graafian
collagenases and several complement zymogens, such as Cl and CS.

It claaves fibrin, fibronectin, thrombospondin, laminin and von
Willebrand factor.

Higher selectivity than trypsin. Converts fibrin into soluble
 199

 84 HLGELTVTLSPH----FSTVKRIIMYTGSPGPPGSSGDIALVQLSSPVALSSQ----VQP 135
 products.

--- ENZYME REGULATION: Converted into plasmin by plasminogen activators being bound to fibrin. Cannot be activated with streptckinase.

--- PTM: N-LINKED GLYCAN CONTAINS N-ACETYLLACTOSAMINB, SIALIC ACID AND IS CORE FUCOSYLLAND. O-LINKED GLYCANS CONSIST OF GAL-GALNAC DISACCHARIDE WITH IS MODIFIED WITH UP TO 2 SIALIC ACID RESIDUES (MICROHETEROGENEITY).

--- MISCELLANEOUS: Plasmin is inactivated by alpha-2-antiplasmin immediately after dissociation from the clot.

--- SIMILARITY: Belongs to peptidase family S1. Plasminogen subfamily.

--- SIMILARITY: Contains 5 kringle domains.

The series protease mcAPI expressed in a mouse cortical by the series mcAPI expressed in a mouse cortical collecting duct cell line.;
The series mcAPI expressed in a mouse cortical collecting and cell line.;
The series a trypsin-like cleavage specificity (By inilarity). Activates aniloride-sensitive sodium channels.

SUBGNIT: Heterodime of two chains, light and heavy, held by a disulfide bond (By similarity).

SUBCELDULAR LOCATION: MEMBRANE-BOUND. SECRETED AFTER CLEAVAGE OF ITS C-TERMINUS (BY SIMILARITY).

SIMILARITY: Belongs to peptidase family 31.

LIAMBARIY: Ref. 1 sequence differs from that shown due to a frameshift in position 339.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. SPTREMBL\_25:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The invention relates to a composition comprising one or more domains of muckinase-type plasminogen activator (uPA). The composition is used to endothelial cell or tissue. The composition is used to endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypotension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, surgically induced thrombotic disorders, pulmonary fibrosis, asthma, tumour cell invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, diabetic retinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pilmonary hypertension, microvascular thrombotic occlusion, and a disorder associated with chronic intrapulmonary fibrin formation. The present sequence is human LMM-urokinase-type plasminogen activator (uPA) protein
 Composition for modulating muscle cell and tissue contractility for treating atherosclerosis, asthma, hypertension, glaucoma, impotence, comprising domains from urokinase-type plasminogen activator.

composition for modulating muscle cell and tissue contractility for treating atherosclerosis, asthma, hypertension, glaucoma, impotence, comprising domains from urokinase-type plasminogen activator.

Claim 23; Fig 1G; 117pp; English

The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (upA). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, andothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microangiopathies, suspically induced thrombotic disorders, angiogenic disorders, upulmonary fibrosis, asthma, tumour cell angiogenesis, tumour cell metastasis, glaucoma, clabetic retinopathy, wound healing, clotting disorder, uterine contraction disorder, male impotence, respiratory disease or condition such as asthma, adult respiratory distress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder sequence is human urokinase-type plasminogen activator (upA) deltakringle chain urokinase (scuPA) and deltakringle-two chain urokinase deletion mutant

New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
 Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derivs. Which have both improved fibrinolytic and thrombin-inhibiting activities, compared to know plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac

 Amino acid residues 1-46 contain the EGF region of human urokinase. Delection of this region results in a plasminogen activator with reduced affinity for liver cell membranes; the mutant protein is not cleared from the circulation as rapidly as is wild-type tPA. The specification only gives the sequence around the deletion and not the full-length sequence of "delta 1-46 urokinase"; the sequence in AAR68854 has been obtained by amending a previously disclosed wild-type human urokinase sequence (from WO9501427) according to the description given in Example 3. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 16-OCT-2003 to standardise

New bifunctional urokinase derivs and related plasmids - with improved fibrinolytic and thrombin inhibiting activities, for treating cardiac and cerebral infarct, pulmonary embolism, etc.
 PCWVISATHCFIDYPKKEDYIVYLGRSRLNSNTQGEMKFEVENLILHKDYSADTLAHHND 120
 Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R66266 are specific examples of such derives. Which have both improved fibrinollytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003 to correct PM field.)

 Bifunctional urokinase derivatives corresponding to the formula M4-X1-Y1 are claimed (see features table). Sequences AAR66244-R6626 are specific examples of such derives which have both improved fibrinolytic and thrombin-inhibiting activities, compared to known plasminogen activators or thrombin inhibiting activities, compared to known plasminogen activators or thrombin inhibitors. The proteins are useful as thrombolytic agents, e.g. for treatment of arterial occlusions, deep vein thrombosis, cardiac and cerebral infarction and pulmonary embolism. (Updated on 25-MAR-2003 to correct PN field.)

Dymogen AAP50871 is the inactive precursor form of human urokinase. Urokinase zymogen is cleaved into the two-chain form composed of characteristic urokinase H (molecular wt.of 30,000) and L (molecular wt.of 20,000) chains when treated with catalytic amounts of plasmin. The patentors claim a new urokinase zymogen which has mol. wt. ca. 50,000, a single chain molecular structure, and selective affinity for fibrin. It is a thrombolytic agent which manifests its plasminogen activator activity on cleavage by proteolytic enzymes (e.g. plasmin) and has higher affinity for fibrin than known forms of urokinase

 It was extracted from human renal cells and purified using a monoclonal antibody for single-chain prourckinase (scPU) recovered from hybridoma cells created from the fusion of mouse myelmen cells with mouse BALB/c spleen cells which had been preliminarily immunised with scPU. The purified product has a molecular weight of $4,000 in $SDS/polyacrylamide gel electrophoresis. The combined use of scPU and plasminogen at a specific ratio can enhance fibriolytic activity of scPU without causing any systemic fibrinosysis. This enables lowering the dose of scPU which thrombosis and obstructive diseases

 Modified pro-urokinase has a longer half-life in blood, and disolves thrombin without causing the spontaneous bleeding associated with urokinase. The modification puts an epidermal growth factor domain into the protein, containing the sequence Asn-X-Ser or Asn-X-Thr where X is any residue. Plasmid pHR27 is disclosed as containing the modified
 Human pro-urokinase variant - produced by recombinant methods, showing increased half life in blood and high affinity for fibrin.

 AAR62991 is the wild type pro-urokinase, from which the new mutants described in AAR62992.R63108 were derived. These mutants retain the thrombolytic activity of the wild type protein, useful for the treatment of thromboembolism, but have a reduced fibrinogenolysis activity and nonspecific plasminogen activation. The mutants can therefore be used for the lysis of fibrin clots without inducing systemic bleeding, as can be the case with the wild type protein. (Updated on 25-MAR-2003 to correct PN field.)

This sequence represents human pro-urokinase. The mature urokinase consists of an A- and B-chain, linked by a single disulphide bond; and is consists of an A- and B-chain, linked by a single disulphide bond; and is generated by proteolytic cleavage of the peptide bond between Lys 135 and Lys [16 159] Additional cleavage of the peptide bond between Lys 135 and Lys contains an ESF-like domain and a kringle domain, while the B-chain contains the catalytic domain. Urokinase The urokinase A-chain contains the catalytic domain. Urokinase activates plasminogen which, in turn, activates the matrix as serine protease and is strongly associated with tumour cells. Urokinase activates plasminogen which, in turn, activates the matrix matrix and promote tumour contains as effective anticancer that specifically target urokinase may serve as effective anticancer agents. A novel method for identifying such serve as cleaved anticancer agents. A novel method for identifying such ligands used X-ray crystallography to determine if a complex is formed between a ligand and a target biomolecule. However, crystals of a native urokinase/inhibitor complex had poor diffraction quality. Human urokinase constructione engineered so that it would produce crystals with the desired qualities. This engineered urokinase was designated mu-UK

The present sequence shows the wild-type urokinase plasminogen activator (UPA). Cyclic peptides based on the amino acids residues 20-30 (the receptor-binding region) of uPA are claimed. These cyclic peptides target the UPA receptor (UPAR). Allowing theirapeutic or diagnostic agents to be receptor-binding region) of uPA are claimed. These cyclic peptides are used, coptionally when linked to a therapeutic agent, to inhibit migration, invasion and proliferation of cells, or angiogenesis, or to induce apoptosis. Particularly they are used, in human or vetrinary medicine, to treat diseases characterized by these processes, e.g. solid tumors, leukaemia or lymphoma (or their metastases); benigh hyperplasia; neovascula cherosolerosis, restenosis; ischaemia, deep vein thrombosis; neovascula cherosolerosis, restenosis; schaemia, deep vein thrombosis; neovascula cherosolerosis, restenosis; ischaemia, deep vein thrombosis; neovascula cherosolerosis; restenosis; ischaemia, deep vein thrombosis; neovascula checosolerosis; ischaemia, deep vein thrombosis; neovascula checosolerosis; ischaemia, deep vein thrombosis; neovascula checosolerosis; neovascula checosolerosis; neovascula checosolerosis; neovascula checosolerosis; neovascula checosolerosis; neovascula checosolerosis; neovascula checosolerosis; neovascula checosolerosis; neovascula checosolerosis; neovascula checosolerosis; neovascula

 The present sequence is that of human pro-urokinase plasminogen activator (pro-upA). The invention provides a uPA receptor (uPAR) targeting protein or peptide that is labelled and used in methods of diagnosis and therapy. The labelled protein or peptide preferably has the following properties: it comprises at least 38 amino acid residues, including residues 13-30 of the uPAR binding site of uPA, competes with labelled preparation of a cell or molecule that has a binding site for uPA, has an ICSO value of about 10 nM or less; and is not a fusion protein. Preferred molecules of about 10 nM or less; and is not a fusion protein. Preferred molecules of about 10 nM or less; and is not a fusion protein. Preferred molecules of single chain uPA, tcuPA (inactivated with the suicide inhibitor disopropyl fluorophosphate), the N-terminal ATF fragment (amino acids 1-135 or 1-143) of uPA, or the growth factor domain (residues 4-43). Sultable labels include a radionuclide, a PTF-imageable agent, a fluorescer, a chromogen, a phosphorescer, a chromogen, a phosphorescer, a chromogen, a phosphorescer, a chromogen, a phosphorescer, a chromogen, cell invasion (preferably

invasiveness of tumour cells), cell proliferation or angiogenesis, or to diduce apoptosis, preferably in the treatment of a subject having a disease or condition associated with undesized cell magration, invasion, proliferation or angiogenesis (claimed). The protein or peptide is also useful for treating diseases or conditions including primary growth of a solid tumour, leukaemia or Lymphoma, tumour invasion, metastasis, atherosclerosis, myocardial angiogenesis, telangiectasia, corneal disease, rubeosis, movoacular glaucoma, diabetic and other retinopathy, macular degeneration, arthitis, fibrosis, wound healing with scarring and fibrosis peptic ulcers, bone fracture, keloids, or a disorder of vaculogenesis, heematopoiesis, ovulation, menstruation, pregnancy or placentation associated with pathogenic cell invasion or with the protein or peptide probe is internalised by the cells to which it binds, e.g. tumour cells, and is useful for imaging tenhiques in which it reduces the background signal relative to specifically bound probes. This uptake permits clearance of circulating to probe elsewhere in the body increases

 The present invention describes a prourokinase mutant comprising the amino acid sequence point mutation at proline 309. The mutation makes the mutant have an intrinsic activity 2.5-20 times lower than that of natural prourokinase, including lowered fibrinogen dissolving activity and lowered non-specific fibrin dissolving zymogen activation. Compared with the natural prourokinase, the fibrin dissolving zymogen activation of the mutant may be promoted by not only the E segment of degraded fibrin but also the D segment. The present sequence represents a wild type prourokinase protein sequence which is used in an example from the present invention. N. B. The sequence in the specification is of poor quality so the sequence given here is of the indexers best interpretation

The invention relates to a composition comprising one or more domains of urokinase-type plasminogen activator (uPh). The composition is used to modulate the contractility and angiogenic activity of a mammalian muscle, endothelial cell or tissue. The composition is used for treating stroke, hypotension, hypertension, atherosclerosis, heart attack, microvascular occlusions, thrombotic microandiopathies, surgically induced thrombotic disorders, angiogenic disorders, upulmonary fibrosis, asthma, tumour cell invasion, tumour cell angiogenesis, tumour cell metastasis, glaucoma, clasorder, male impotence, respiratory disress syndrome, primary pulmonary hypertension, microvascular thrombotic occlusion, and a disorder sesonic intrapulmonary fibrin formation. The present sequence is human urokinase-type plasminogen activator (HDA) two chain curokinase (tcuPA) and single chain urokinase (scuPA) protein 195 255 180 315 PCWVISATHCFIDYPKKEDYIVYLGRSRLNSNTQGEMKFEVENLILHKDYSADTLAHHND 120 9 136 KPSSPPEELKFQCGGKTLRPRFKIIGGEFTTIENQPWFAAIYRRHRGGSVTYVCGGSLIS 256 IALLKIRSKEGRCAQPSRTIQTICLPSMYNDPQFGTSCEITGFGKENSTDYLYPEQLKMT KPSSPPEELKFQCGQKTLRPRFKIIGGEFTTIENQPWFAAIYRRHRGGSVTYVCGGSLIS IALLKIRSKEGRCAQPSRTIQTICLPSMYNDPQFGTSCEITGFGKENSTDYLYPEQLKMT VVKLISHRECQQPHYYGSEVTTKMLCAADPQWKTDSCQGDSGGPLVCSLQGRMTLTGIVS tumour cell metastasis; glaucoma; diabetic retinopathy; wound healing; clothing disorder; uterine contraction disorder; respiratory disease; male impotence; adult respiratory distress syndrome; tcuPA; scuPA; two chain urokinase; single chain urokinase. ```
The present sequence is the protein sequence of human mature single chain urokinase plasminogen activatox (scupA). A method of preventing or decreasing the severity of scarring in a subject involves obtaining a pharmaceutical composition comprising (scupA) or a scupA mimetic and administering the pharmaceutical composition to a subject. A method of screening for compounds that prevent scarring involves obtaining scupA or its mimetic, and testing its ability to prevent scarring. The injury is the result of acute/Adult respiratory distress syndrome (ARDS), perminedially irradiation or hyperoxia-induced lung injury, particulate-induced lung injury associated with the man scupA or modified scupA. In a preferred method, testing uses a cultured cell (sepecially a cultured rabbit pleural mesothelial cell or lung fibroblast) or test animal (sepecially a rabbit having tetracycline induced pleural injury). The pharmaceutical composition is directly administered to a site in the subject, intrapleurally or as an aerosol

APUK(k,k) is an example of a prourokinase derivative which has increased affinity for blood clots and attacks the components of a thrombus whilst sparing the circulating clotting proteins and platelets. The first 13 N-terminal amino acids replace the first 3 amino acids of natural urokinase. This derivative has a fibrin lysis activity of 9.2 x 10 power4 international units/O.D.280. See also AAQ1022-3 and AAQ10225. (Updated on 25-MAR-2003 to correct PA field.)
 Human prourokinase - like polypeptide(s) with thrombolytic action - have oligopeptide(s) which bind covalently to blood clot (thrombus) by action of Factor XIII.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Publication No. US20030148410A1

GENERAL INFORMATION

APPLICANT: Millennium Pharmaceuticals, Inc.

APPLICANT: Guillenette, Tracy L.

APPLICANT: Guillenette, Tracy L.

APPLICANT: Guillenette, Subbardi

APPLICANT: Guillenette, Tracy L.

APPLICANT: Monahan, John E.

APPLICANT: Monahan, John E.

APPLICANT: Monahan, John E.

APPLICANT: Monahan, John E.

APPLICANT: Monahan, John E.

APPLICANT: MATHORS FOR IDENTIFICATIONS, KITS, AND

TITLE OF INVENTION: THERAPY OF COLON CANCER

TITLE OF INVENTION: THERAPY OF COLON CANCER

TITLE OF INVENTION: THERAPY OF COLON CANCER

TITLE OF INVENTION: THERAPY OF COLON CANCER

TITLE OF INVENTION UNMERR: US (1)/301,822

CURRENT APPLICATION NUMBER: US 60/339,971

PRIOR PILING DATE: 2002-01-21

PRIOR PILING DATE: 2002-03-05

PRIOR PILING DATE: 2002-03-05
      APPLICANT: Kanatkar, Shubhangi
APPLICANT: Karen
APPLICANT: Glart, Karen
APPLICANT: Ganavarapu, Manjula
APPLICANT: Ganavarapu, Manjula
APPLICANT: Ganavarapu, Manjula
APPLICANT: Hoersh, Sebastian
ITILE OF INVENTION: NOVEL GENES, COMPOSITIONS, KITS, AND METHODS FOR
TITLE OF INVENTION: DIDANTIPLICATION, ASSESSMENT, PREVENTION, AND THERAPY
ITILE OF INVENTION: OF CERVICAL CANCER
FILE REFERENCE: MRI-035
CURRENT APPLICATION NUMBER: US/10/17,311
CURRENT FILING DATE: 2002-06-13
